### AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

#### LISTING OF CLAIMS:

1. (Currently amended) A method for use in authenticating a service network to a station, the station having a home environment network, the method comprising:

storing a key at the service network;  
transmitting information to the station from the service network that enables the station to compute the key stored at the service network;  
receiving a request for service at the service network from the station;  
adjusting a verification value at each usage of the key; and  
transmitting, from the service network to the station, information corresponding to the verification value ~~to the station~~ that forms a part of a verification computation enabling the station to authenticate the service network.

2. (Original) The method of claim 1, further comprising

receiving a vector of authentication information from the home environment network of the station, the vector including an indication of the vector's position in a sequence of vectors; and  
wherein transmitting information to the station that enables the station to compute the key stored at the service network comprises transmitting portions of the received vector of authentication information.

3. (Original) The method of claim 2, wherein the received vector of authentication information comprises the key stored by the service network.

Serial No. 09/710,541  
Atty Dkt: 99-956

4. (Original) The method of claim 2, further comprising computing at the service network the key stored by the service network based on information included in the received vector.

5. (Previously presented) The method of claim 1, wherein adjusting a verification value comprises incrementing a sequence number corresponding to a number of times the key has been used.

6. (Previously presented) The method of claim 5, wherein the verification value comprises a TSQN (Temporary Sequence Number).

7. (Original) The method of claim 1, wherein  
the station comprises a cellular phone; and  
the service network and home environment networks comprise cellular networks.

8. (Original) The method of claim 1, further comprising using the key to compute a cipher key for encrypting communication between the service network and the station.

9. (Original) The method of claim 1, further comprising negotiating use of a cryptographic primitive between the service network and the home environment network.

10. (Original) The method of claim 1, further comprising  
transmitting a challenge to the station;  
receiving a challenge response from the station; and  
comparing the received challenge response with an expected response.

11. (Original) The method of claim 1, further comprising:  
computing the key stored by the service network at the station;

Serial No. 09/710,541  
Atty Dkt: 99-956

receiving the information indicating the value corresponding to key usage at the station; and

comparing the received value with a value corresponding to key usage maintained by the station.

12. (Currently amended) A method for use in authenticating a service network to a station, the station having a home environment network, the method comprising:

receiving information at the station from the service network;

computing a key based on the information ~~received at the station~~ transmitted from the service network to the station, the computed key also being stored by the service network;

maintaining an indicator of key usage at the station;

~~receiving at~~ transmitting, from the service network to the station, an indicator of key usage maintained by the service network; and

comparing the key usage indicator maintained by the service network with the key usage indicator maintained by the station enabling the station to authenticate the service network.

13. (Original) The method of claim 12, further comprising:

maintaining an authentication vector sequence number at the station;

receiving at the station from the service network an indication of an authentication vector sequence number maintained by the home environment network; and

comparing the authentication vector sequence number maintained by the home environment network with the received authentication vector sequence number maintained by the station.

14. (Original) The method of claim 13, further comprising receiving from the service network identification of a cryptographic primitive.

Serial No. 09/710,541  
Atty Dkt: 99-956

15. (Original) The method of claim 12, wherein  
the station comprises a cellular phone; and  
the service network and home environment network comprise cellular networks.
16. (Original) The method of claim 12, further comprising:  
using the key to compute a cipher key for encrypting communication between the  
service network and the station.
17. (Original) The method of claim 12, further comprising:  
receiving a challenge from the service network;  
determining a challenge response; and  
transmitting the challenge response to the service network.
18. (Original) The method of claim 12, wherein maintaining an indicator of key usage at  
the station comprises maintaining a key sequence number counter.
19. (Currently amended) A method for use in authentication in a communications  
network including a home environment network, a service network, and a station, the  
method comprising:  
storing a key at the service network;  
transmitting information to the station from the service network that enables the  
station to compute the key stored at the service network;  
receiving a request for service at the service network from the station;  
adjusting a verification value at each usage of the key;  
transmitting, from the service network to the station, information corresponding to  
the verification value that forms a part of a verification computation enabling the station  
to authenticate the service network;

Serial No. 09/710,541  
Atty Dkt: 99-956

determining at the home environment network a cryptographic primitive offered to the home environment by the service network;  
and

based on the determined cryptographic primitive, transmitting to the service network at least one vector of authentication information corresponding to a particular station.

20. (Original) The method of claim 19, wherein determining comprises receiving identification of the cryptographic primitive from the service network.

21. (Original) The method of claim 20, wherein the identification comprises a value of a MODE field.

22. (Original) The method of claim 19, wherein the vector of authentication information comprises an indication of an authentication vector sequence number maintained by the home environment network.

23. (Original) The method of claim 22, wherein the vector of authentication information comprises a challenge and an expected response.

24. (Currently amended) A method for use by a mobile station that can communicate with different service networks, the method comprising:

storing different sets of cryptographic information for the different respective service networks;

selecting one of the sets of cryptographic information for one of the service networks; and

using the one selected set of cryptographic information to communicate with the one of the service networks to authenticate the one of the service networks to the station by:

Serial No. 09/710,541  
Atty Dkt: 99-956

storing a key at the one of the service networks;  
transmitting information to the station from the one of the service  
networks that enables the station to compute the key stored at the one of the service  
networks;  
receiving a request for service at the one of the service networks from the  
station;  
adjusting a verification value at each usage of the key; and  
transmitting, from the one of the service networks to the station,  
information corresponding to the verification value that forms a part of a verification  
computation enabling the station to authenticate the service network.

25. (Currently amended) The method of claim 24, wherein each of the sets of cryptographic information comprises the key shared by the station and a respective service network.

26. (Previously presented) The method of claim 25, further comprising computing the key shared by the station and the one service network based on information received from the one service network.

27. (Currently amended) The method of claim 25, wherein each of the sets of cryptographic information ~~[[comprise]]~~ comprises an indicator of usage of the key.

28. (Original) The method of claim 27, wherein the indicator of usage comprises a sequence number.

29. (Previously presented) The method of claim 27, further comprising:  
receiving from the one service network an indicator of key usage maintained by the one service network; and

Serial No. 09/710,541  
Atty Dkt: 99-956

comparing the indicator of key usage maintained by the one service network with the indicator of key usage included in the one selected set of cryptographic information.

30. (Previously presented) The method of claim 25, wherein using the one selected set of cryptographic information comprises using the one selected set of cryptographic information to authenticate the service network.

31. (Previously presented) The method of claim 25, wherein using the one selected set of cryptographic information comprises using the one selected set of cryptographic information in encrypting communication between the station and the service network.

32. (Currently amended) A method of handling authentication and key agreement in a system including a home environment network, a service network, and a mobile station, the method including authenticating the service network to the mobile station, the home environment network and the mobile station sharing a secret key K, the method comprising:

determining whether the home environment and the service network share a cryptographic primitive offered by the service network;

if it is determined that the home environment and the service network do not share a cryptographic primitive, handling authentication and key agreement between the mobile station and the service network using 3GPP (Third Generation Project Partners) AKA (authentication and key agreement); and

if it is determined that the home environment and the service network share a cryptographic primitive, handling authentication and key agreement and authenticating the service network to the mobile station by:

computing a shared secret key (SSK) within the system excluding the station;

storing the SSK at the service network;

Serial No. 09/710,541  
Atty Dkt: 99-956

transmitting information from the service network to the station that enables the station to compute the SSK; [[and]]  
replacing the use of K in the 3GPP AKA with the SSK;  
receiving a request for service at the service network from the station;  
adjusting a verification value at each usage of the SSK; and  
transmitting, from the service network to the station, information  
corresponding to the verification value that forms a part of a verification computation  
enabling the station to authenticate the service network.
